- ➊ Introduction
- ➋ Bounds on Densities in $\mathbb{F}_{q^m}^n$
- ➌ Asymptotic Densities in $\mathbb{F}_{q^m}^n$
- ➍ Densities of Optimal Codes in $\mathbb{F}_{q^m}^n$
- ➎ Subspace Codes in $\mathcal{G}_q(k, n)$
- ➏ Summary and Conclusions

Interest in Random Codes (Hamming Metric)

- For fixed rate and growing length a random code (linear or non-linear) gets arbitrarily close to channel capacity for BSC and BEC (Shannon '48, Elias '55).
- Analogous result for list-decoding capacity for BSC (Guruswami-Haastad-Kapparty '10)
- For fixed length/rate, but growing field size, a random linear code is MDS (folklore).

Interest in Random Codes (Hamming Metric)

- For fixed rate and growing length a random code (linear or non-linear) gets arbitrarily close to channel capacity for BSC and BEC (Shannon '48, Elias '55).
- Analogous result for list-decoding capacity for BSC (Guruswami-Haastad-Kapparty '10)
- For fixed length/rate, but growing field size, a random linear code is MDS (folklore).
- For LRCs the locality is not a generic property, but the optimality w.r.t. Hamming distance is. (Neri-H. '19)
- In code-based cryptography we need to estimate the minimum distance of a random linear code.
→ Random linear codes achieve Gilbert-Varshamov bound w.h.p.

Interest in Random Codes (Other Metrics)

- There exist many non-Gabidulin MRD codes, for growing field extension degree. (Neri-H.-Randrianarisoa-Rosenthal '17)
- Nonlinear and $\mathbb{F}_q$ -linear MRD codes are sparse for growing field size. (Gluesing-Luerssen-Byrne, Gruica-Ravagnani '20-'22)
- Random linear codes in Lee and restricted error metric achieve normalized GV bound for growing length. (Weger-Battaglioni-Santini-H.-Persichetti, Byrne-H.-Khaturia-Weger '21)
- Random linear sum-rank-metric codes are MSRD w.r.t. field extension degree. (Ott-Puchinger-Bossert '21)
- Random good constant dimension codes (e.g. spreads) are sparse. (Gruica-Ravagnani '21)

Our Results

- General bounds on density of (linear, sub-linear, non-linear) codes in translation-invariant metric vector spaces.
- Asymptotic behavior in all parameters (length, field size, linearity degree).
- GV-bound achievement in general.
- Singleton-type bound achievement in Hamming, rank, sum-rank, injection/subspace metric. (Some new, some re-established.)

Relation to Finite Geometry I

Hamming metric:

$$d_H(u, v) := |\{i \mid u_i \neq v_i\}|$$

$$\text{MDS} \longleftrightarrow d_H(C) = n - \log_q(|C|) + 1$$

Theorem

- *Linear MDS codes in $\mathbb{F}_{q^m}^n$ correspond to n -arcs over $\mathbb{F}_{q^m}$.*
- *(Additive or) $\mathbb{F}_q$ -linear MDS codes in $\mathbb{F}_{q^m}^n$ correspond to n -arcs of $(m-1)$ -spaces.*
- For linear codes the columns of the generator matrix form the n -arc.
- For additive codes we extend columns row-wise over $\mathbb{F}_q$ and view them as $(m-1)$ -spaces.

Relation to Finite Geometry II

Rank metric on $\mathbb{F}_{q^m}^n$:

$$d_R(u, v) := \dim_q \langle u_1 - v_1, \dots, u_n - v_n \rangle$$

$$\text{MRD} \longleftrightarrow \log_q(|C|) = \max(m, n)(\min(m, n) - d_R(C) + 1)$$

Theorem

MRD codes in $\mathbb{F}_{q^n}^n$ of maximal rank distance $d = n$ are spreadsets.

- *MRD codes in $\mathbb{F}_{q^n}^n$ (containing the zero and identity matrix) with minimum distance n correspond to finite quasifields Q with $K \leq \text{Ker}Q$ and $\dim_q Q = n$.*
- *Additive MRD codes in $\mathbb{F}_{q^n}^n$ (containing the identity matrix) with minimum distance n correspond to finite semifields S with $K \leq \text{Ker}S$ and $\dim_q S = n$.*
- *$\mathbb{F}_q$ -linear MRD codes in $\mathbb{F}_{q^n}^n$ (containing the identity matrix) with minimum distance n correspond to finite division algebras D over $\mathbb{F}_q$ where $\mathbb{F}_q \leq Z(D)$ and $\dim_q D = n$.*

Relation to Finite Geometry III

Subspace/injection metric on $\mathcal{G}_q(k, n)$:

$$d_S(U, V) := k - \dim(U \cap V)$$

Theorem

- A subspace code in $C \subseteq \mathcal{G}_q(k, n)$ is a set of subspaces where the elements intersect pairwise in dimension at most $k - d_S(C)$.
- If $d_S(C) = k$ then these codes are spreads or partial spreads.

- 6 Summary and Conclusions

Graph Theory Tools¹

- Construct bipartite graph $\mathcal{B} = (\mathcal{V}, \mathcal{W}, \mathcal{E})$, where
 - ▶ $\mathcal{V} = \left\{ \{x, y\} \subseteq \mathbb{F}_q^n : x \neq y, D(x, y) \leq d - 1 \right\}$,
 - ▶ $\mathcal{W}$ is the collection of codes $\mathcal{C} \subseteq \mathbb{F}_q^n$ with $|\mathcal{C}| = S$, and
 - ▶ $(\{x, y\}, \mathcal{C}) \in \mathcal{E}$ if and only if $\{x, y\} \subseteq \mathcal{C}$.

¹From A. Gruica and A. Ravagnani, *Common complements of linear subspaces and the sparseness of MRD codes*, SIAM Journal on Applied Algebra and Geometry 6 (2022).

Graph Theory Tools¹

- Construct bipartite graph $\mathcal{B} = (\mathcal{V}, \mathcal{W}, \mathcal{E})$, where
 - ▶ $\mathcal{V} = \left\{ \{x, y\} \subseteq \mathbb{F}_q^n : x \neq y, D(x, y) \leq d - 1 \right\}$,
 - ▶ $\mathcal{W}$ is the collection of codes $\mathcal{C} \subseteq \mathbb{F}_q^n$ with $|\mathcal{C}| = S$, and
 - ▶ $(\{x, y\}, \mathcal{C}) \in \mathcal{E}$ if and only if $\{x, y\} \subseteq \mathcal{C}$.
-

$$|\mathcal{V}| = \frac{1}{2} q^n \left(\mathbf{v}_q^D(\mathbb{F}_q^n, d - 1) - 1 \right), \quad |\mathcal{W}| = \binom{q^n}{S},$$

$$|\{\mathcal{C} \in \mathcal{W} : (\{x, y\}, \mathcal{C}) \in \mathcal{E}\}| = \binom{q^n - 2}{S - 2}.$$

¹From A. Gruica and A. Ravagnani, *Common complements of linear subspaces and the sparseness of MRD codes*, SIAM Journal on Applied Algebra and Geometry 6 (2022).

Graph Theory Tools¹

- Construct bipartite graph $\mathcal{B} = (\mathcal{V}, \mathcal{W}, \mathcal{E})$, where
 - ▶ $\mathcal{V} = \left\{ \{x, y\} \subseteq \mathbb{F}_q^n : x \neq y, D(x, y) \leq d-1 \right\}$,
 - ▶ $\mathcal{W}$ is the collection of codes $\mathcal{C} \subseteq \mathbb{F}_q^n$ with $|\mathcal{C}| = S$, and
 - ▶ $(\{x, y\}, \mathcal{C}) \in \mathcal{E}$ if and only if $\{x, y\} \subseteq \mathcal{C}$.

•

$$|\mathcal{V}| = \frac{1}{2} q^n \left(\mathbf{v}_q^D(\mathbb{F}_q^n, d-1) - 1 \right), \quad |\mathcal{W}| = \binom{q^n}{S},$$

$$|\{\mathcal{C} \in \mathcal{W} : (\{x, y\}, \mathcal{C}) \in \mathcal{E}\}| = \binom{q^n - 2}{S - 2}.$$

- Hence $\mathcal{B}$ is a left-regular graph of degree $\binom{q^n - 2}{S - 2}$. The isolated vertices are the codes of minimum distance d .
→ Bounds for number of such is known.

Density of Non-Linear Codes

Metric space $(\mathbb{F}_q^n, D)$, volume of ball $\mathbf{v}_q^D(\dots)$, density $\delta_q^D(\dots)$

Theorem

The density of codes in $\mathbb{F}_q^n$ with minimum distance d among all codes of cardinality S is bounded by

$$1 - \frac{(\mathbf{v}_q^D(\mathbb{F}_q^n, d-1) - 1)S(S-1)}{2(q^n - 1)} \leq \delta_q^D(\mathbb{F}_q^n, S, 0, d),$$

$$\delta_q^D(\mathbb{F}_q^n, S, 0, d) \leq 1 - \frac{(\mathbf{v}_q^D(\mathbb{F}_q^n, d-1) - 1)S(S-1)}{2\Theta(q^n - 1)},$$

where

$$\Theta = 1 + \frac{(2\mathbf{v}_q^D(\mathbb{F}_q^n, d-1) - 4)(q^n - 3) + (\frac{1}{2}q^n(\mathbf{v}_q^D(\mathbb{F}_q^n, d-1) - 1) - 2\mathbf{v}_q^D(\mathbb{F}_q^n, d-1) + 3)(S-3)}{(S-2)^{-1}(q^n - 2)(q^n - 3)}.$$

Density of (Sub-)Linear Codes

Theorem

The density of $\mathbb{F}_{q^\ell}$ -linear codes in $\mathbb{F}_{q^m}^n$ ($m = s\ell$) of cardinality S with minimum distance d is bounded by

$$1 - \frac{(v_q^D(\mathbb{F}_{q^m}^n, d-1) - 1) \begin{bmatrix} ns-1 \\ k-1 \end{bmatrix}_{q^\ell}}{(q^\ell - 1) \begin{bmatrix} ns \\ k \end{bmatrix}_{q^\ell}} \leq \delta_q^D(\mathbb{F}_{q^m}^n, q^{\ell k}, \ell, d)$$

$$\delta_q^D(\mathbb{F}_{q^m}^n, q^{\ell k}, \ell, d) \leq 1 - \frac{(v_q^D(\mathbb{F}_{q^m}^n, d-1) - 1) \begin{bmatrix} ns-1 \\ k-1 \end{bmatrix}_{q^\ell}}{\bar{\Theta}(q^\ell - 1) \begin{bmatrix} ns \\ k \end{bmatrix}_{q^\ell}},$$

where $\bar{\Theta} = 1 + \begin{bmatrix} ns-1 \\ k-1 \end{bmatrix}_{q^\ell}^{-1} \left(\frac{v_q^D(\mathbb{F}_{q^m}^n, d-1) - 1}{q^\ell - 1} - 1 \right) \begin{bmatrix} ns-2 \\ k-2 \end{bmatrix}_{q^\ell}.$

Rank Metric Asymptotics

Theorem

- *Non-linear MRD codes are sparse:*

$$\lim_{q,n,m \rightarrow +\infty} \delta_q^{\text{rk}}(\mathbb{F}_{q^m}^n, q^{\max\{n,m\}(\min\{n,m\}-d+1)}, 0, d) = 0.$$

- *Sub-linear (quasi-)MRD codes depend on the linearity degree:*
 $\ell s \geq n$:

$$\lim_{q \rightarrow +\infty} \delta_q^{\text{rk}}(\mathbb{F}_{q^{\ell s}}^n, q^{\ell s(n-d+1)}, \ell, d) = \begin{cases} 1 & \text{if } \ell > (d-1)(n-d+1), \\ 0 & \text{if } \ell < (d-1)(n-d+1). \end{cases}$$

$\ell s < n$:

$$\lim_{q \rightarrow +\infty} \delta_q^{\text{rk}}(\mathbb{F}_{q^{\ell s}}^n, q^{\ell k}, \ell, d) = \begin{cases} 1 & \text{if } \ell > (d-1)(\ell s - d + 1) + r, \\ 0 & \text{if } \ell < (d-1)(\ell s - d + 1) + r. \end{cases}$$

where $k := \lfloor n(\ell s - d + 1)/\ell \rfloor$ and $r := n(d-1) - \ell \lceil n(d-1)/\ell \rceil$.

Rank Metric Asymptotics II

Theorem

- *Density for growing linearity degree:*

$$\lim_{\ell \rightarrow +\infty} \delta_q^{rk}(\mathbb{F}_{q^{\ell s}}^n, q^{\ell s(n-d+1)}, \ell, d) = 1,$$

- *Bound for growing length:*

$$\limsup_{n \rightarrow +\infty} \delta_q^{rk}(\mathbb{F}_{q^{\ell s}}^n, q^{\ell \lfloor n(\ell s - d + 1) / \ell \rfloor}, \ell, d) \leq \frac{1}{1 + \begin{bmatrix} m \\ d-1 \end{bmatrix}_q q^{-2\ell}} < 1,$$

- *Bound for growing extension degree:*

$$\limsup_{s \rightarrow +\infty} \delta_q^{rk}(\mathbb{F}_{q^{\ell s}}^n, q^{\ell s(n-d+1)}, \ell, d) \leq \frac{q^\ell}{q^\ell + \begin{bmatrix} n \\ d-1 \end{bmatrix}_q} < 1.$$

Non- and sublinear MRD codes for $q = 2, n = 4$ and $m = 4$ (and $n = 15$)

Probability of Spreadsets

Theorem

- *The probability that randomly chosen square matrices in $\mathbb{F}_q^{n \times n}$ form a spreadset goes to 0 for growing growing q or n .*
- *The probability that the $\mathbb{F}_q$ -linear span of randomly chosen square matrices in $\mathbb{F}_q^{n \times n}$ form a spreadset goes to 0 for growing growing q or n .*
- *The probability that the $\mathbb{F}_{q^n}$ -linear span of randomly chosen vectors in $\mathbb{F}_{q^n}^n$ form a spreadset goes to 1 for growing growing q or n .*

($\rightarrow$ connection to quasifields, semifields, division algebras)

Sum-Rank Metric

Ambient space ($n = t\eta$):

$$C \subseteq (\mathbb{F}_{q^m}^\eta)^t$$

Singleton-type bound:

$$k \leq \max\{m, \eta\}(t \min\{m, \eta\} - d + 1)$$

$$\mathbf{v}_q^{\text{sr},t}(\mathbb{F}_{q^m}^n, r) = \sum_{h=0}^r \sum_{u \in U_h} \prod_{i=1}^t \begin{bmatrix} \eta \\ u_i \end{bmatrix}_q \prod_{j=0}^{u_i-1} (q^m - q^j) \sim \binom{t}{\tilde{z}} q^{\frac{\tilde{z}^2}{t} - \tilde{z} + r(m + \eta - \frac{r}{t})}$$

as $q \rightarrow +\infty$, where $\tilde{z} \equiv r \pmod{t}$.

Sum-Rank Metric

Ambient space ($n = t\eta$):

$$C \subseteq (\mathbb{F}_{q^m}^\eta)^t$$

Singleton-type bound:

$$k \leq \max\{m, \eta\}(t \min\{m, \eta\} - d + 1)$$

$$\mathbf{v}_q^{\text{sr},t}(\mathbb{F}_{q^m}^n, r) = \sum_{h=0}^r \sum_{u \in U_h} \prod_{i=1}^t \begin{bmatrix} \eta \\ u_i \end{bmatrix}_q \prod_{j=0}^{u_i-1} (q^m - q^j) \sim \binom{t}{\tilde{z}} q^{\frac{\tilde{z}^2}{t} - \tilde{z} + r(m + \eta - \frac{r}{t})}$$

as $q \rightarrow +\infty$, where $\tilde{z} \equiv r \pmod{t}$.

Theorem

Non-linear MSRD codes are sparse:

$$\lim_{q \rightarrow +\infty} \delta_q^{\text{sr},t}(\mathbb{F}_{q^m}^n, q^{\max\{m, \eta\}(t \min\{m, \eta\} - d + 1)}, 0, d) = 0$$

Sum-Rank Metric II

Theorem

Let $\theta := (d-1) \left(\min\{m, \eta\} - \frac{d-1}{t} \right) + \frac{\tilde{z}^2}{t} - \tilde{z}$.

- If $m \geq \eta$, then:

$$\lim_{q \rightarrow +\infty} \delta_q^{sr,t}(\mathbb{F}_{q^m}^n, q^{m(n-d+1)}, \ell, d) = \begin{cases} 1 & \text{if } \theta < \ell, \\ 0 & \text{if } \theta > \ell \end{cases}$$

- If $\eta > m$, then:

$$\lim_{q \rightarrow +\infty} \delta_q^{sr,t}(\mathbb{F}_{q^m}^n, q^{\ell k}, \ell, d) = \begin{cases} 1 & \text{if } \theta - r < \ell, \\ 0 & \text{if } \theta - r > \ell, \end{cases}$$

where $k = \left\lfloor \frac{\eta(mt-d+1)}{\ell} \right\rfloor$ and $r = \ell \left(\left\lceil \frac{\eta(d-1)}{\ell} \right\rceil - \frac{\eta(d-1)}{\ell} \right)$.

Sum-Rank Metric III

Corollary

Let $m \geq \eta$ and $2 \leq d \leq n$ be integers. We have

$$\lim_{q \rightarrow +\infty} \delta_q^{sr,t}(\mathbb{F}_{q^m}^n, q^{m(n-d+1)}, 1, d) = \begin{cases} 1 & \text{if } \eta < \frac{2}{\sqrt{t}} \\ 0 & \text{if } \eta > \frac{(t+2)^2}{4t}. \end{cases}$$

Density of Codes in the Grassmannian

Metric space $(\mathcal{G}_q(k, n), D)$, volume of ball $\mathbf{v}_q^D(\dots)$, density $\delta_q^D(\dots)$

Theorem

The density of codes in $\mathcal{G}_q(k, n)$ with minimum distance d among all codes of cardinality S is bounded by

$$1 - \frac{(\mathbf{v}_q^D(\mathcal{G}_q(k, n), d-1) - 1)S(S-1)}{2\left(\left[\begin{smallmatrix} n \\ k \end{smallmatrix}\right]_q - 1\right)} \leq \delta_q^D(\mathcal{G}_q(k, n), S, d),$$

$$\delta_q^D(\mathcal{G}_q(k, n), S, d) \leq 1 - \frac{(\mathbf{v}_q^D(\mathcal{G}_q(k, n), d-1) - 1)S(S-1)}{2\Theta\left(\left[\begin{smallmatrix} n \\ k \end{smallmatrix}\right]_q - 1\right)},$$

$$\Theta = 1 + 2\frac{(\mathbf{v}_q^D(d-1)-2)(S-2)}{\text{bin}(n,k,q)-2} + \frac{(\frac{1}{2}\text{bin}(n,k,q)(\mathbf{v}_q^D(d-1)-1)-2\mathbf{v}_q^D(d-1)+3)(S-2)(S-3)}{(\text{bin}(n,k,q)-2)(\text{bin}(n,k,q)-3)}.$$

Asymptotic Density

Theorem

$$\lim_{q, n \rightarrow \infty} \delta_q^D(\mathcal{G}_q(k, n), S_q, d) = \begin{cases} 1 & \text{if } \mathbf{v}_q^D(\mathcal{G}_q(k, n), d-1) \in o\left(\begin{bmatrix} n \\ k \end{bmatrix}_q S_q^{-2}\right) \\ 0 & \text{if } \mathbf{v}_q^D(\mathcal{G}_q(k, n), d-1) \in \omega\left(\begin{bmatrix} n \\ k \end{bmatrix}_q S_q^{-2}\right) \end{cases}$$

Asymptotic Density

Theorem

$$\lim_{q,n \rightarrow \infty} \delta_q^D(\mathcal{G}_q(k, n), S_q, d) = \begin{cases} 1 & \text{if } \mathbf{v}_q^D(\mathcal{G}_q(k, n), d-1) \in o\left(\begin{bmatrix} n \\ k \end{bmatrix}_q S_q^{-2}\right) \\ 0 & \text{if } \mathbf{v}_q^D(\mathcal{G}_q(k, n), d-1) \in \omega\left(\begin{bmatrix} n \\ k \end{bmatrix}_q S_q^{-2}\right) \end{cases}$$

GV-bound:

$$S_{[n,k,q,d]} \geq \frac{\begin{bmatrix} n \\ k \end{bmatrix}_q}{\mathbf{v}_q^D(\mathcal{G}_q(k, n), d-1)}$$

Corollary

Non-linear codes achieving the Gilbert-Varshamov bound are asymptotically sparse with respect to q or n .

Codes with the Subspace/Injection Distance²

$$d_I(U, V) := k - \dim(U \cap V)$$

$$|\mathbf{v}_q^I(\mathcal{G}_q(k, n), d)| = \sum_{i=0}^d q^{i^2} \begin{bmatrix} k \\ i \end{bmatrix}_q \begin{bmatrix} n - k \\ i \end{bmatrix}_q$$

Singleton-type bound:

$$|C_{[n,k,d]}| \leq \begin{bmatrix} n - d + 1 \\ \max(k, n - k) \end{bmatrix}_q$$

Theorem

$$\lim_{q, n \rightarrow \infty} \delta_q^D(\mathcal{G}_q(k, n), \begin{bmatrix} n - d + 1 \\ \max(k, n - k) \end{bmatrix}_q, d) = 0$$

($\rightarrow$ GV-bound is lower than Singleton-type bound)

²A. Gruica and A. Ravagnani, *The Typical Non-Linear Code over Large Alphabets*, IEEE Information Theory Workshop (ITW), 2021.

Bounds for $(q, k, n) = (2, 4, 8), (2, 4, 10)$

Geometric Interpretation

$$d_I(U, V) < d \iff \dim(U \cap V) > k - d$$

Theorem

Let $d \geq 2$. A set of

$$\frac{\begin{bmatrix} n \\ k \end{bmatrix}_q}{v_q^I(\mathcal{G}_q(k, n), d-1)} \leq \begin{bmatrix} n-d+1 \\ \max(k, n-k) \end{bmatrix}_q$$

randomly chosen k -dimensional subspaces in $\mathbb{F}_q^n$ contains a pair of elements which intersect in dimension at least $k - d + 1$, with probability going to 1 for growing q or n .

Geometric Interpretation II

$$d_I(U, V) < d \iff \dim(U \cap V) > k - d$$

Theorem

Let $d \geq 2$. A set of

$$\left(\frac{\begin{bmatrix} n \\ k \end{bmatrix}_q}{v_q^I(\mathcal{G}_q(k, n), d-1)} \right)^{\frac{1}{2}}$$

randomly chosen k -dimensional subspaces in $\mathbb{F}_q^n$ intersect pairwise in dimension at most $k - d$, with probability going to 1 for growing q or n .

- 1 Introduction
- 2 Bounds on Densities in $\mathbb{F}_{q^m}^n$
- 3 Asymptotic Densities in $\mathbb{F}_{q^m}^n$
- 4 Densities of Optimal Codes in $\mathbb{F}_{q^m}^n$
- 5 Subspace Codes in $\mathcal{G}_q(k, n)$
- 6 Summary and Conclusions

Summary and Conclusions

- General (asymptotic) bounds on densities in $(\mathbb{F}_{q^m}^n, D)$ and $(\mathcal{G}_q(k, n), D)$, D translation-invariant.

Summary and Conclusions

- General (asymptotic) bounds on densities in $(\mathbb{F}_{q^m}^n, D)$ and $(\mathcal{G}_q(k, n), D)$, D translation-invariant.
- Density/sparsity depends on relation of volume of balls to code cardinality.

Summary and Conclusions

- General (asymptotic) bounds on densities in $(\mathbb{F}_{q^m}^n, D)$ and $(\mathcal{G}_q(k, n), D)$, D translation-invariant.
- Density/sparsity depends on relation of volume of balls to code cardinality.
- All non-linear codes we considered are sparse (GV- or Singleton-achieving).

Summary and Conclusions

- General (asymptotic) bounds on densities in $(\mathbb{F}_{q^m}^n, D)$ and $(\mathcal{G}_q(k, n), D)$, D translation-invariant.
- Density/sparsity depends on relation of volume of balls to code cardinality.
- All non-linear codes we considered are sparse (GV- or Singleton-achieving).
- $\mathbb{F}_{q^\ell}$ -linear codes always achieve GV-bound (with probability 1) for growing q or $\ell = m/s$.

Summary and Conclusions

- General (asymptotic) bounds on densities in $(\mathbb{F}_{q^m}^n, D)$ and $(\mathcal{G}_q(k, n), D)$, D translation-invariant.
- Density/sparsity depends on relation of volume of balls to code cardinality.
- All non-linear codes we considered are sparse (GV- or Singleton-achieving).
- $\mathbb{F}_{q^\ell}$ -linear codes always achieve GV-bound (with probability 1) for growing q or $\ell = m/s$.
- For Singleton-type bound it depends on the metric and the linearity degree.

Summary and Conclusions

- General (asymptotic) bounds on densities in $(\mathbb{F}_{q^m}^n, D)$ and $(\mathcal{G}_q(k, n), D)$, D translation-invariant.
- Density/sparsity depends on relation of volume of balls to code cardinality.
- All non-linear codes we considered are sparse (GV- or Singleton-achieving).
- $\mathbb{F}_{q^\ell}$ -linear codes always achieve GV-bound (with probability 1) for growing q or $\ell = m/s$.
- For Singleton-type bound it depends on the metric and the linearity degree.
